SpeechWeb & Adobe Captivate

towards a revolution in education

Richard Frost
School of Computer Science
University of Windsor

ITS 2012 Windsor

Questions

1. **Given that speech is a fundamental method of communication:**

   - Why are there so few web-based “speech applications”.
   - Why are there so few natural-language “English” interfaces to web applications and data?
   - Why are there hardly any “speech games” on the web?

2. **Given that YouTube is so easy to use:**

   - Why do we not have more “college and university lessons” available on YouTube?

Possible Answers

1. **Speech and natural-language applications**
   - Speech technology is immature.
   - NL theories cannot be computerized.
   - There is no market for such applications
   - Few people are interested in creating speech & NL apps.
   - Speech and NL technologies are extremely difficult.

2. **YouTube lessons**
   - Instructors are not interested in creating on-line lessons.
   - Video capture technology is difficult to use.

A different perspective

- **Speech technology is very mature (e,g, Google speech apps, iPhone 4S)**
- **Compositional theories of natural language are available.**
- **The market for NL speech applications is huge, as is on-line learning.**
- **Many people are interested in these technologies BUT think that they are very difficult.**

My Thesis

- **Technology, interest and NOTATION is now available for non-experts to create natural-language speech applications and deploy them on the web.**
- **Video capture technology is available that allows non-experts to build computer based lessons and deploy them on YouTube and elsewhere.**
- **In the next few years we will see a massive increase in NL speech interfaces to knowledge and access to on-line lessons which will revolutionize education.**

We begin with an analogy

An old tune goes global

- **Pachelbel composed the “Canon” (late 1600s)**

  http://www.youtube.com/watch?v=8Af372EQLck

- **Jerry C (Chang) re-arranged for electric guitar around “Canon Rock” (2005)**

  http://www.youtube.com/watch?v=by8oyJztzwo

- **A youtube user, Impeto, spliced together 39 excerpts of musicians playing and called it the “Ultimate Canon Rock” (2007)**

  http://www.youtube.com/watch?v=dMWl_5NujBw

What helped Jerry C teach a wide range of people to play the Canon and participate in the "Ultimate Canon Rock"

- Electric guitar (1930's)
- The Web (Tim Berners-Lee 1990's)
- YouTube
- Guitar TAB reborn in 40's, widely used now

```
----------------------|----------------------|----------------------
--19~--------15~------|--16~--------13~------|--14~--------11~------
----------------------|----------------------|----------------------
----------------------|----------------------|----------------------
----------------------|----------------------|----------------------
----------------------|----------------------|----------------------
```

And now for something completely different

A video demonstration of SpeechWeb created using Adobe Captivate Software.

www.youtube.com (and type in “speechweb”)

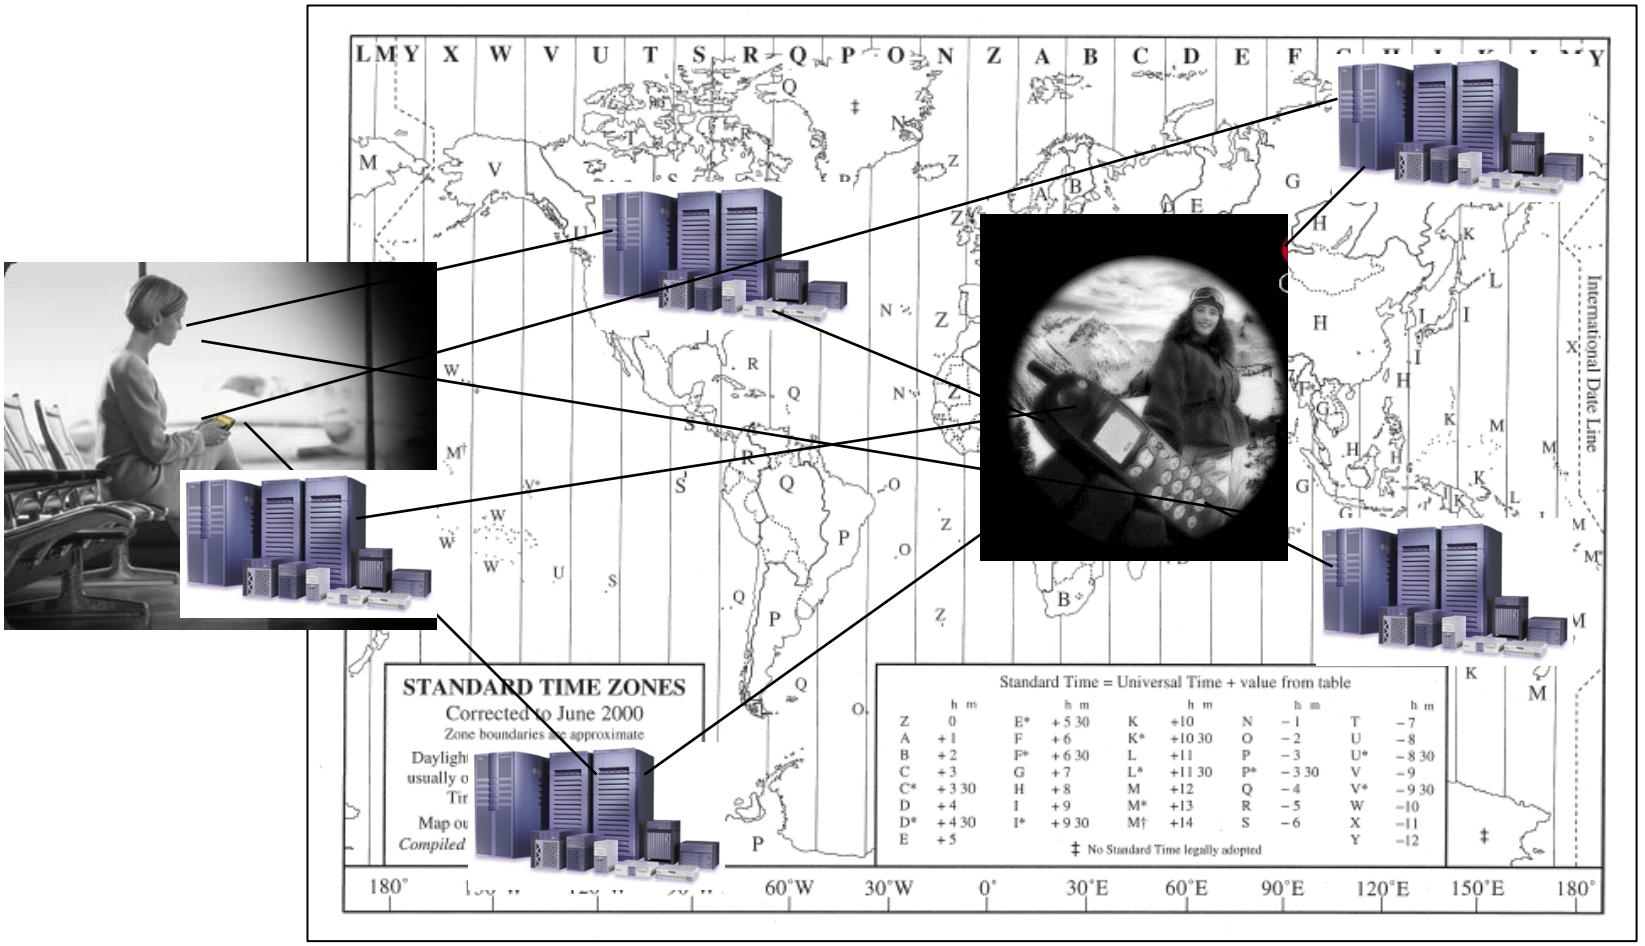
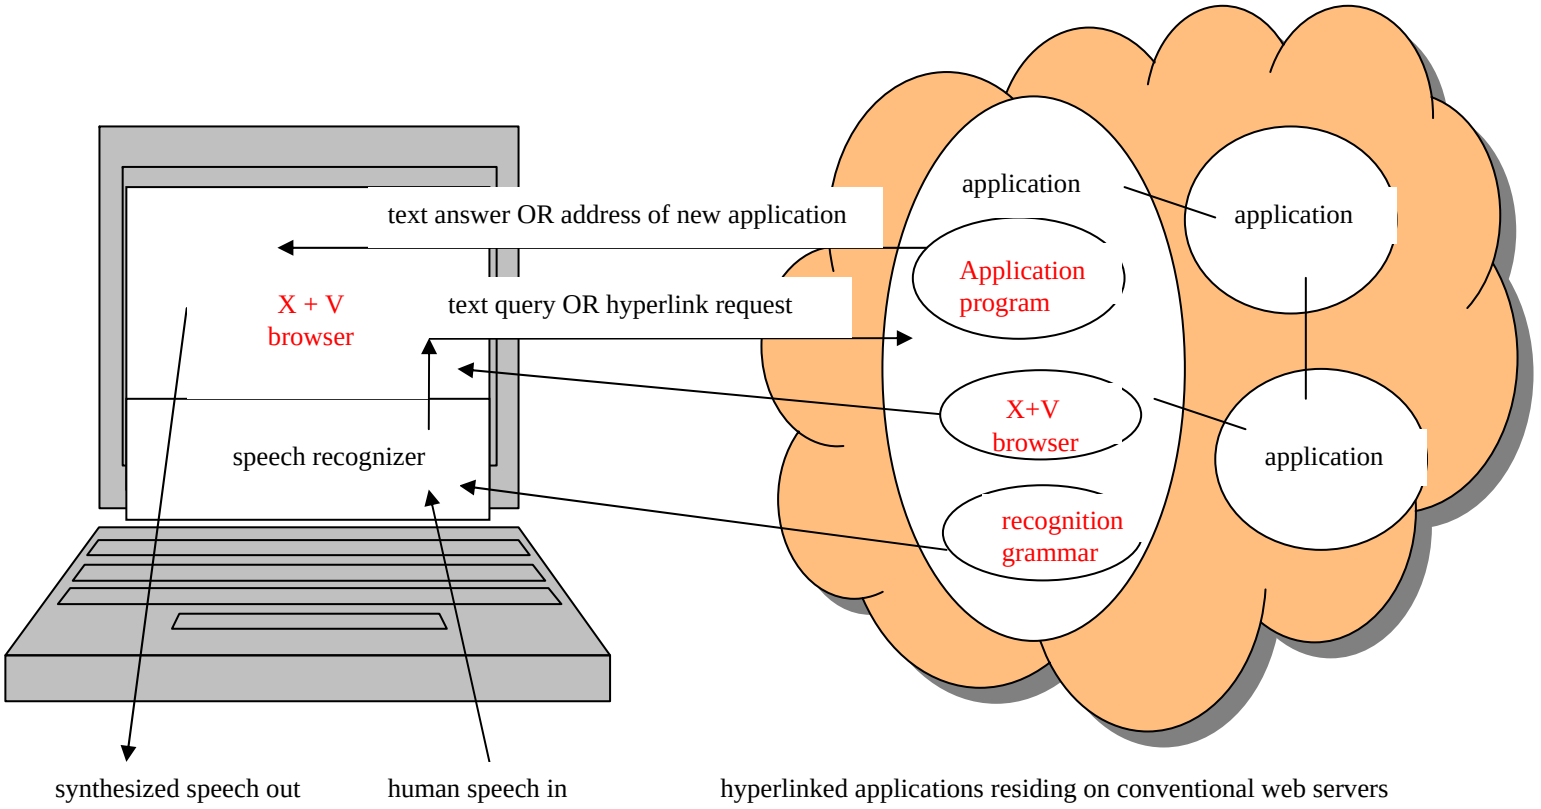
A Brief Overview of SpeechWeb Technology

- The SpeechWeb architecture
- The speech browser interface
- How to create a SpeechWeb application and deploy on the web.
- The mathematical basis of natural language processing.
- A summary of the notation which has made it possible.

Local Recognition Remote Processing (LRRP) Architecture



Applications in the cloud



To Create a SpeechWeb Application

- **Copy three files into a web directory**
  1. The X+V browser
  2. A sample grammar
  3. A sample program

- **Modify four lines in the X+V browser**

- **Change the grammar for your application's input language.**

- **Modify the sample program or replace with a program, written in any language to process the input.**

ALL SIMPLE NOTATION?

The X+V Browser

```
•<html xmlns="http://www.w3.org/1999/xhtml" xmlns:vxml……
•  <head>
•    <title id="title" />

•    <!-- the name of the speechweb application and its opening statement are specified here -->
•    <script type="text/javascript">
•      var appName = “Monty";
•      var appFullName = “speechweb.cs.uwindsor.ca/applications/Monty";
•      var greeting = “Hello. My name is Monty. I know a joke.";
•    </script>

•    <!-- main vxml form for handling the user/application dialogue -->
•    <vxml:form id="vxml_main">
•      <vxml:field name="vxml_field" modal="true">
•              <vxml:grammar type="application/x-jsgf" src=“Monty.jsgf" />

•              <vxml:prompt cond="greeting.length > 0">
•                <vxml:value expr="showMessage('greeting', greeting)" />
•                <vxml:value expr="greeting" />
•                <vxml:value expr="greeting = "" />
•              </vxml:prompt>
•etc …….
```

Recognition Grammars Guide Search

```
<question>      = what is your name
                | where do you live
                | what do you know
                | tell me a joke
                | can I talk to <person>
                | etc ;

<person>        = judy | solarman | pete …
```

The Programs can be as simple as you want

```
interpret "what is your name" = "My name is Monty.“

interpret "where do you live"
                  = "I hang out in one of Frosties computers. “

interpret "what do you know"
                  = "I got a joke or two. Not much else.“

interpret “tell me a joke"
                  = “Did you hear about the two professors……."
```

The Basis of the Natural language Technology

Variation of Montague's NL semantics (1970's) developed in the λ-calculus (Church 1930's), and implemented in set-theory.

$[[\text{Mars}]] = \lambda s \quad e_{mars} \in s$

$[[\text{spin}]] = \{e_{earth}, e_{mars}, e_{luna}, \ldots\}$

$[[\text{moon}]] = \{e_{luna}, e_{phobos}, \ldots..\}$

$[[\text{Mars}]]\ [[\text{spins}]] \Rightarrow (\lambda s \ e_{mars} \in s)\ \{e_{earth}, e_{mars}, \ldots\}$
$\Rightarrow e_{mars} \in \{e_{earth}, e_{mars}, \ldots\}$
$\Rightarrow$ True

$[[\text{every}]] = \lambda p\ \lambda q\ \ p \text{ subset } q$

The result is a fully compositional semantics

- **The composition rule is always simple function application, e.g.**

  (hall or kuiper) (discovered (every moon))

- **The semantics covers a large sub-set of classical first-order English.**

  `does every moon and every planet spin`

  `how many moons that orbit a red planet were discovered by the person who discovered Nereid`

  `which planet is orbited by no moon`

- **The meaning of words can be defined in terms of other words.**

$$[\![\texttt{discoverer}]\!] = [\![\texttt{person who discovered a thing}]\!]$$

The notation which simplifies creation and deployment of NL speech applications

- VXML (X+V) to configure/interface to the speech recognizer
- BNF notation for recognizer grammars
- Declarative/equational programming languages
- λ calculus and set theory for NL

Adobe Captivate

- **Captures all screen activity and voice over (and sounds from a computer session).**
- **Clever capture minimizes resulting video.**
- **Publish as .pdf, .mp4 etc and directly to YouTube.**
- **Can edit video and sound.**
- **Learning curve similar to PowerPoint.**
- **Can be used with tablets to create “Khan-style” online lessons: http://www.khanacademy.org/**

Use of speech and captivate technology in Education

- **Non experts can add speech interfaces to their web applications.**
- **Non experts can create lessons about anything and deploy them on the web.**
- **In the future we will be able to create interactive on-line lessons with spoken natural-language interfaces.**

Multi-Modal Online Education

Using speech games to create cognitive profiles

- Video games are being used to develop cognitive profiles of users. Can help identify learning strengths and weaknesses in children.
- Speech games can add another “dimension” to the cognitive profiles.
- We are currently designing speech-only games for children aged 6 and above.
